

iPhone® and Blackberry® Users Offered Military-Grade Encryption

Now Gold Lock Enterprise™ extends their ability to provide triple-layer voice and data encryption to iPhone and Blackberry users seeking to protect their voice and data transmissions from being monitored and intercepted by hackers, competitors, intelligence agencies, and criminals.

Rehovot, Israel , 18 September 2009 – Gold Line Group Ltd. (www.gold-lock.com) today publically announced the newest upgrade to their Gold Lock Enterprise™, a triple layer end-to-end encryption suite that now supports iPhone and Blackberry in addition to its legacy support for Nokia® cell phones, computers, and Windows® mobile devices.

Government and civilian Gold Lock users depend upon the software to turn their cell phones, PCs and handheld computers into an encrypted digital fortress thanks to military-grade encryption algorithms God lock licenses from the Israeli Ministry of Defense.

Originally compatible only with select Nokia® handsets, the company later added support for HTC® and Samsung® products. The addition of support for iPhone and Blackberry now makes encrypted data and voice communications, file transfers and SMS messaging possible for all of the most widely used digital communication devices.

The software utilizes AES 256-bit and Elliptic Curve 256-bit encryption for protecting data and Diffie Hellman 4096-bit encryption for securing key transfers. All encryption is executed using the protected device's native processing power, so no additional hardware or training is required.

“We did a soft launch of our latest Gold Lock upgrade at the Sydney Security Exposition in August, and it was received with great response and interest by attendees from the public and private security and intelligence sectors,” according to Noam Copel, Gold Lock's CEO. “In an era of heightened criminal and terrorist activities, keeping communications secure is no longer a novelty; it can be a matter of life or death,” Copel added.

Gold Lock is so sure confident of the secure algorithms used in their products that they are making available a free file sample of a Gold Lock call, as grabbed by a network sniffer, for testing. Despite numerous attempts made both by internal Gold Lock experts and external hacker teams, not a single successful decryption has ever been executed since 2003.

To learn more about Gold Lock Enterprise™ and other Gold Lock encryption solutions or to download a free fully-functioning 15-day trial version, visit <http://www.gold-lock.com>. And if you consider yourself a crypto expert, don't forget to download the sample encrypted call.
